Payment Status

RiskPay API

This publically available API provided by RiskPay allows you to generate payment links anonymously without KYC. You can accept Credit/Debit Cards (including Visa, MasterCard, and Maestro), PayPal, Apple Pay, Google Pay, ACH or SEPA bank transfers. You will receive instant payouts to your USDC (Polygon) wallet address once the customer pays using the link. For more information, visit our company website https://www.riskpay.biz

For successful payment link generation, you need to take two mandatory steps:

- Create a temporary encrypted wallet using `GET` Wallet Creation by passing your own USDC (Polygon) wallet address to receive payouts + a unique callback URL to receive a response. Optionally, you can use the affiliate.php wallet creator and pass an additional wallet you own to earn an affiliate percentage commission on every sale.
- Redirect the customer to the payment page by passing the generated encrypted wallet address along with other required parameters through another `GET` request to Payment Processing. This request will directly send the customer to the payment page.

Please visit the Minimum Order Amounts page for more information about minimum order rules for different payment providers.

GETCurrency Conversion

https://api.riskpay.biz/control/currency-conversion.php?value=79.95&from=EUR

Some providers like `wert`, `stripe`, `transfi`, and `rampnetwork` support USD only. You may need to convert your amount to USD currency.

Request Example

- `value` : The amount of the currency you want to convert to USD.
- `from` : The code of the currency you want to convert to USD, for example, EUR or SEK.

Response Example

- `status` : Status of the response.
- `value_coin` : Converted amount to USD.
- `exchange_rate` : Currency conversion rate to USD.

PARAMS

GETCallback Handling

https://www.riskpay.biz/callback?number=20250516&value_coin=105.6&coin=polygon_usdc&txid_in=0x45b82c1aefda36f7980e2b4c3f01a765de48b9c214f7fed963ab52d30e7c8bc&txid_out=0x622f94b6aefbc78d3502e1c9f0b4a3d7c065df4b39ac812f7fed1942d50e3cn&address_in=0x32e854bD1270670C832634CA87858fFd9F3e2c78

When a payment is made by one of the providers our bot will visit your callback URL using the `GET` request method. All your original parameters will be included plus the following payment data parameters:

Request Example

- `value_coin` : Amount of USDC paid by the provider.
- `coin` : Payout coin type, usually polygon_usdc or polygon_usdt.
- `txid_in` : Polygon TXID of the payment made from the provider to the order-assigned wallet.

- `txid_out` : Instant payout TXID from the order assigned wallet to your merchant-predefined wallet.
- `address_in` : This should match the same `polygon_address_in` unencrypted wallet generated at the first step.

Response Example

- This request doesn't return any response headers or body.

GET Payment Status

https://api.riskpay.biz/control/payment-status.php?ipn_token=ZEE2cW8zb1N0N2otZEc3eDBCd2xTeVlmekExYWZKMTBYN1lJclp5T2ZCR05WUmloZzdtdlNyQTdsS3ZJRldSRg%3D%3D

Use this endpoint to check the payment status.

Request Example

- `ipn_token` : You should have this from the first request creating the wallet.

Response Example

- `status` : Status of the payment. Can be either `paid` or `unpaid`.
- `value_coin` : Amount of crypto sent by the provider to the assigned wallet.
- `txid_out` : TXID of the payout transaction to your merchant wallet on the blockchain.
- `coin` : The payout coin type usually polygon_usdc.

Critical Warning !

This endpoint is intended to be used on casual basis only to check the payment status and payout info when needed. However you shouldn't rely on this endpoint to change order status on your own website/system to avoid getting rate limited. To change order status within your own website system you should rely on the Callback Event where our bot will hit your server when the payment is made.
